EXAMPLE OF PLC, PLC WITH SCO, AND ARC-CO

Prof. Howard Leathers
University of Maryland
Maryland Agricultural Extension
United States Department of Agriculture
Risk Management Agency

“This institution is an equal opportunity provider.”
Our website:
http://www.arec.umd.edu/extension/crop-insurance
Wheat in Northumberland County, VA.

What we need for our examples:

7 different yield measures
6 different price measures
2 different area measures
Yield Measures

- Actual Production History (APH) yields per harvested for the individual farm.
- County average yields per planted acre for the last five years.
- County t-yields for the last five years
- “Expected” county yield for SCO.
- “Program yield” for the individual farm.
- Current (hypothetical) yield for the individual farm.
- Current (hypothetical) yield for the county.

- (Not included: district yields/planted acre for years when county yields are not available.)
Actual Production History for our sample farm:

<table>
<thead>
<tr>
<th>year</th>
<th>yield</th>
</tr>
</thead>
<tbody>
<tr>
<td>2004/05</td>
<td>60</td>
</tr>
<tr>
<td>2005/06</td>
<td>60</td>
</tr>
<tr>
<td>2006/07</td>
<td>75</td>
</tr>
<tr>
<td>2007/08</td>
<td>65</td>
</tr>
<tr>
<td>2008/09</td>
<td>60</td>
</tr>
<tr>
<td>2009/10</td>
<td>75</td>
</tr>
<tr>
<td>2010/11</td>
<td>60</td>
</tr>
<tr>
<td>2011/12</td>
<td>60</td>
</tr>
<tr>
<td>2012/13</td>
<td>60</td>
</tr>
<tr>
<td>2013/14</td>
<td>75</td>
</tr>
</tbody>
</table>

Average APH 65

Different for each farm, but known at the time the example is computed.
## County yield History:

<table>
<thead>
<tr>
<th>year</th>
<th>Actual yield</th>
<th>T-yield</th>
<th>70% of t-yield</th>
<th>Higher of Actual yield or 70% of t-yield</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009/10</td>
<td>47.9</td>
<td>63</td>
<td>44.1</td>
<td>47.9</td>
</tr>
<tr>
<td>2010/11</td>
<td>73.5</td>
<td>63</td>
<td>44.1</td>
<td>73.5</td>
</tr>
<tr>
<td>2011/12</td>
<td>67.5</td>
<td>63</td>
<td>44.1</td>
<td>67.5</td>
</tr>
<tr>
<td>2012/13</td>
<td>72.1</td>
<td>63</td>
<td>44.1</td>
<td>72.1</td>

<td>48.3</td>
<td>74</td>
</tr>
</tbody>
</table>

**Olympic average county yield**

|                |              |              |                | 71.03 |

Different for each county, but known (except for 2013/14) at the time the example is computed. Actual yields Northumberland Co. VA, are from NASS website. The 2013/14 yield reflects the expected growth in national yield shown in the August WASDE report, also available at NASS website. T-yields are from RMA website.
Other yields for our sample farm and county:

Program yields: PLC payments are based on program yields, which differ from farm to farm. They can be updated to a recent four year average of yields on the farm; so we are using the 2005-09 average from the actual yield history for our sample farm: Program yield = 61.25

“Expected” county yield for supplemental coverage insurance: this is based on a complicated formula using county yields back to 1972. The expected county yields can be found on the University of Illinois crop insurance calculator. “Expected” county yield = 74

Different for each farm and county, but known. (Program yield FAS, expected county yield RMA).
Current Yield for our sample farm and county:

This can take different values, for different hypothetical examples.

We will use “low” values of yield not because that is likely, but because it illustrates how the various parts of the safety net work.

When current yields are relatively high, program payments and insurance indemnities are likely to be zero.

Assumed farm yield = 55
Assumed county average yield = 65
Price Measures

- Marketing year average price (MYA) for the last five years.
- PLC reference price.
- Average post-harvest months futures price during pre-planting month.
- Average post-harvest month’s futures price during harvest month.
- MYA (hypothetical) for upcoming year.
- Actual selling price for the individual farm in the upcoming year.

(Not included on this list: Loan rates, posted county price on date of LDP claim, should MYA fall below loan rate.).
<table>
<thead>
<tr>
<th>Year</th>
<th>Actual national MYA price</th>
<th>PLC reference price</th>
<th>Higher of last two columns</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009/10</td>
<td>4.87</td>
<td>5.5</td>
<td>5.5</td>
</tr>
<tr>
<td>2010/11</td>
<td>5.38</td>
<td>5.5</td>
<td>5.5</td>
</tr>
<tr>
<td>2011/12</td>
<td>7.24</td>
<td>5.5</td>
<td>7.24</td>
</tr>
<tr>
<td>2012/13</td>
<td>7.77</td>
<td>5.5</td>
<td>7.77</td>
</tr>
<tr>
<td>2013/14</td>
<td>6.87</td>
<td>5.5</td>
<td>6.87</td>
</tr>
</tbody>
</table>

Olympic average price for county ARC: 6.54

Different for each county, but known (except for 2013/14) at the time the example is computed. Actual yields Northumberland Co. VA, are from NASS website. The 2013/14 yield reflects the expected growth in national yield shown in the August WASDE report, also available at NASS website. T-yields are from RMA website.
Other prices:

Average of September 2015 CBOT wheat futures price during the period August 15-September 15, 2014: $6.00

(This is a rough guess, but founded in actual futures prices.)

Back to prices head page.
Hypothetical prices for the “current” upcoming crop year.

Average of September 2015 CBOT wheat futures price during the period July 2015: $5.20
MYA price for the 2014/15 crop year: $5.00

Actual farmer selling price: $5.30

(These are made up, and deliberately low, prices to illustrate how the programs and insurance policies work.)
Area Measures

- Actual planted acres  200 acres
- Base acres  150 acres

(Not included on this list: Actual insured acres, should those differ from actual planted acres.)
Review of all assumptions

- Things which are known to a considerable degree:
  - Olympic average County Yield Average: **71.03**
  - “expected” county yield for SCO: **74**
  - Olympic average County-ARC price: **$6.54**
  - Base revenue insurance price: $6.00
  - PLC reference price: $5.50

- Characteristics of our imaginary “sample” farm, things known from that farm’s past:
  - AYH average yield: 65
  - Program yield: 61.25
  - Base wheat acres: 150
  - Actual wheat acres: 200
Review of all assumptions

• Hypothetical future events
  • Assumed farm yield = 55
  • Assumed county average yield = 65
  • Assumed insurance harvest price = $5.20
  • MYA price for the 2014/15 crop year: $5.00
  • Actual farmer selling price: $5.30
Market Revenue under this scenario

Selling price: $5.30
Farm yield = 55
acres = 200

Market Revenue = 5.30 x 55 x 200 = 58,300
Insurance indemnity payments at 75% coverage

Futures market insurance price: 6.00
APH average yield: 65
Insured revenue per acre: 6.00 x 65 x .75 = 292.50

Futures market harvest price: 5.20
Farm yield: 55
“Actual” revenue per acre: 5.20 x 55 = 286.00

Covered acres: 200
Indemnity payment (292.50 – 286.00) x 200 = $1300
PLC payments under this scenario

Payment rate: 5.50 − 5.00 = .50
Program yield = 61.25
Base acres = 150

PLC payment = .50 x 61.25 x 150 x .85 = 3,904.69
SCO indemnity payments under this scenario

Futures market insurance price: 6.00
Expected average county yield: 74
SCO benchmark: $6.00 \times 74 = 444$
SCO trigger: $6.00 \times 74 \times 0.86 = 381.84$

Futures market harvest price: 5.20
Actual county yield: 65
“Actual revenue” per acre: $5.20 \times 65 = 338.00$
Actual county revenue as % of SCO benchmark: 0.7613

Farm APH yield: 65
Futures market insurance price: 6.00
Farm expected revenue: $6.00 \times 65 = 390$
Maximum SCO liability: $(0.86 - 0.75) \times 390 = 42.9$
SCO indemnity payments under this scenario, continued

Items 1 and 2 from last slide:
Actual county revenue as % of SCO benchmark: \( .7613 \)
Maximum SCO liability: \((.86 - .75) \times 390 = 42.9\)

Shortfall compared to 86%: \( .86 - .7613 = .0987 \)
Maximum percentage SCO coverage (with 75% revenue insurance): \(.86-.75 = .11\)
Shortfall as percentage of maximum: \(.0987/.11 = .8976\)

SCO Indemnity per acre: \(.8976 \times 42.9 = \$38.51\)
SCO Indemnity on 200 acres: \(38.51 \times 200 = \$7702\)
County ARC payments under this scenario.

Olympic average County Yield Average  71.03  
Olympic average County-ARC price: $6.54  
County benchmark:  71.03 x 6.54 = 464.54  
County Revenue guarantee:  71.03 x 6.54 x .86 = 399.50

Actual county yield:  65  
Current MYA price:  5.00  
Actual county revenue:  325

ARC payment rate: lower of  (399.50 – 325) or 10% of 464.54 = 46.45

Base acres: 150

ARC payment: 46.45 x 150 x .85 = 5922.38
Program alternatives under this scenario: Summary

<table>
<thead>
<tr>
<th>Program alternative</th>
<th>Market income</th>
<th>Insurance Indemnity</th>
<th>Program payment</th>
<th>SCO Indemnity</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>County ARC + 75% rev. insur</td>
<td>58,300</td>
<td>1,300</td>
<td>5,922</td>
<td>0</td>
<td>65,522</td>
</tr>
<tr>
<td>PLC + rev. insurance</td>
<td>58,300</td>
<td>1,300</td>
<td>3,905</td>
<td>0</td>
<td>63,505</td>
</tr>
<tr>
<td>PLC + rev. ins. + SCO</td>
<td>58,300</td>
<td>1,300</td>
<td>3,905</td>
<td>7702</td>
<td>71,207</td>
</tr>
</tbody>
</table>

“Normal” or average corn income: 200 acres x 65 b/acre x $6.54/b = $85,020

86% of normal income: $73,117
Revenue insurance at 60% plus SCO
Revenue insurance at 85% no SCO
SCO premiums are more heavily subsidized.

<table>
<thead>
<tr>

What if county yields stay high while farm yields are low?

Individual farm yields are 40, but county yields are 75. Because county yields are high SCO payments are low. Because individual farm yields are low, revenue insurance indemnities are high.

<table>
<thead>
